E-LINE MV General Introduction

Medium Voltage (MV) is manufactured within a single housing, the conductor copper are embedded in DURACOMP insulation which is a composite material of epoxy resin and pure silica minerals with Cu conductors specially selected and the epoxy resin. Medium Voltage busbar systems are designed to operate at voltages of 12 kV and 24 kV. Manufactured as standard up to a rating of 5000 A. Please contact us for higher amperage applications.

Areas of Use

Exterior environments, industrial buildings, petrochemical buildings, regions with flood risk, oil and natural gas industry

MV System Benefits

- Products tested in accordance with international standards
- Corrosion-resistant
- Chemical-resistant
- ▶ Resistance against insects and rodents
- ► Usable in tropical environments
- ► High mechanical strength
- ► Without stack effect
- ▶ Highly resistant to short circuit
- ► Low voltage drop when compared with cable

Short-Circuit Withstand

 Special design for occupying minimum space based on ampere level.

www.eaeelectric.com

- Electroerosion resistant
- UV resistant
- Designed to improve heat loss
- Maintenance-free busbar
- Easy Assembly
- ► An ideal high temperature environments

Short-circuit resistance values tested are presented on the table. High busbar resistance can be seen based on the short-circuit values to be calculated.

Busbar Drawings

You may receive professional assistance is available to our clients by contacting our nearest dealer, distributor or our Project & Design departments for Busbar drawings Blueprints and calculating cost estimates.

High IP Insulation

DURACOMP is a composite material of epoxy resin and pure silicon which gives the E-LINE MV busbar range a high mechanical strength and resistance to high temperatures and external effects as listed on Page 2

EAE Medium voltage busbar systems are manufactured using high density and high conductivity copper conductors. Contact areas of copper conductors can be coated by tin or optionally silver.

Ease of Heat Transfer

Heat forming on the additives used in the system with high heat transfer is easily dissipated to the environment by means of the housing.

Short-Circuit Withstand

High mechanical and thermal resistance thanks to the DURACOMP material.

Housing:

E-Line MV busbar is produced by combining the Duracomp insulated conductor within an extruded aluminium housing.

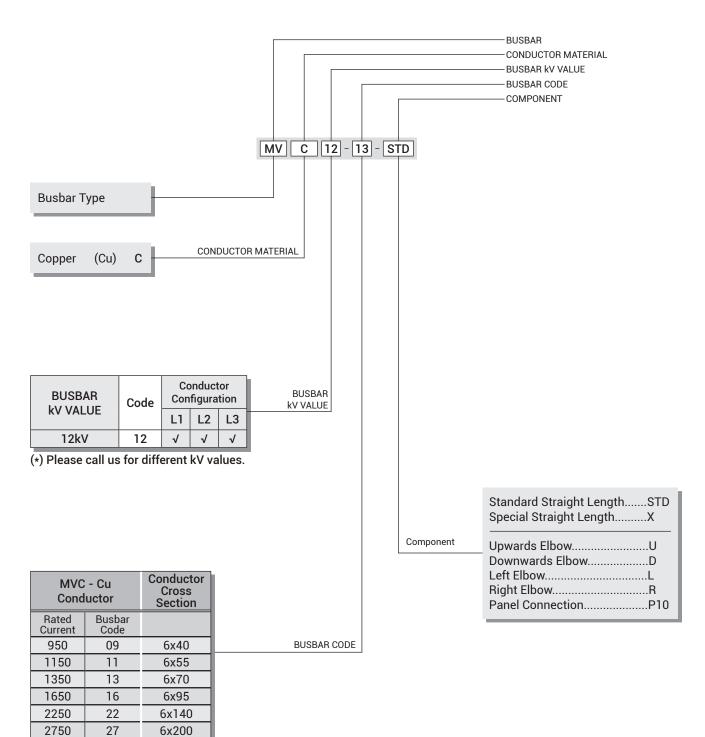

- Light aluminium case

- High Mechanical Strength and Chemical Resistance
- Adjustable support system
- Safety earth continuity
- Very less magnetic field

The "DURACOMP" is a composite material of epoxy resin and pure silicon which gives the E-LINE MV busbar range a high mechanical strength and resistance to high temperatures and external effects.

Conductors are of 99.95% purity electrolytic copper electrolytic copper.

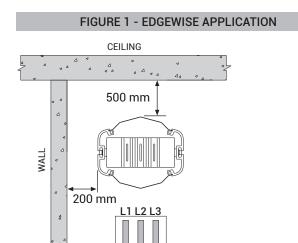

FIGURE 4 - SAMPLE WALL CROSSING WITH FIRE BARRIER

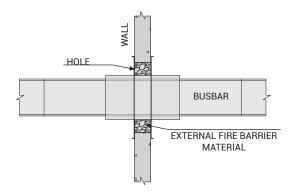

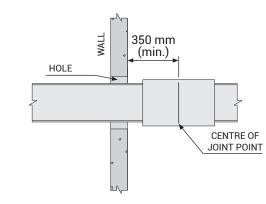

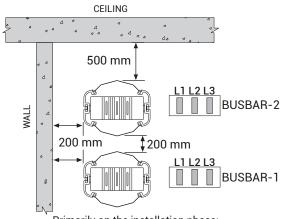

FIGURE 5 - STANDARD WALL CROSSING

Attention !

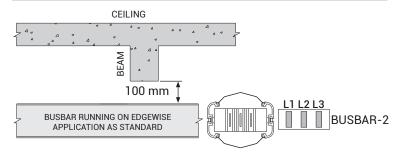

- For correct installation, the dimension from the busbar to the ceiling should not be less than 500mm
- The joint should be not come across to Beams.
- The dimensions given above are minimum values.
- All dimensions are given in mm.

Primarily on the installation phase; BUSBAR-1 line should be installed before BUSBAR-2 line.

E-LINE MV Horizontal Application

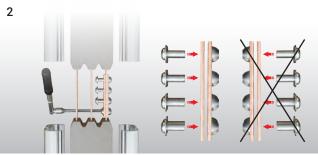

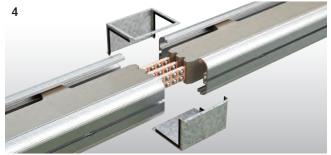

The ends of the conductors of the busbars are cleaned with a clean dry cloth. The busbars have to be fixed in the sameaxis, with a max. distance of 10 mm between the two conductors.

All bolts must be tightened to 72 Nm with torque wrench.

As shown on the figure, junction plates fixed as the bolts face the same direction at all times.

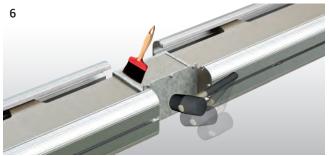

Before assembling the casting moulds, inner surfaces of casting moulds have to be wiped with clean dry cloth.

The prepared for casting should be cast from the same spot at all times.

After the curing of the cast material is completed the sheet metal moulds can be removed. (Reaction is completed within 8 - 24 hours based on the air temperature.) The flexibles are fitted to the profiles grooves for earth continuity.

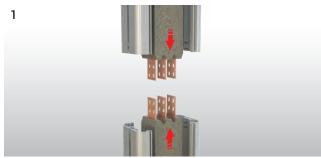

The material should be 'vibrated' with the help of a plastic hammer to remove the air in the material. Then the air bubbles on the surface have to brushed.

Joint protection pieces of perforated aluminium should be fitted.

E-LINE MV Vertical Application

The ends of the conductors of the busbars are cleaned with a clean dry cloth. The busbars have to be fixed in the sameaxis, with a max. distance of 10 mm between the two conductors.

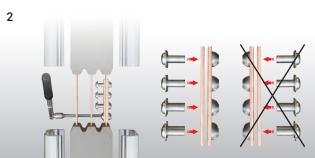

All bolts must be tightened to 72 Nm with torque wrench.

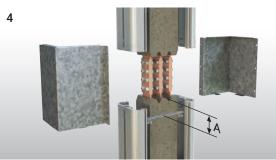

The prepared for casting should be cast from the same spot at all times.

7

After the curing of the cast material is complete the sheet metal moulds can be removed. (Reaction is completed within 8 - 24 hours based on the air temperature.)The flexibles are fitted to the profiles grooves for earth continuity.

As shown on the figure, junction plates fixed as the bolts face the same direction at all times.

Support sheets are secured on the lower part of juncture area by stem bar. A min. 50-60 mm. The joint moulds are affixed on the support sheet by cleaning with a dry and clean piece of cloth.

The material should be "vibrated" with the help of a plastic hammer to remove the air in the material. Then the air bubbles on the surface have to brushed.

Joint protection pieces of perforated aluminium should be fitted.

950 A TO 2750 A MEDIUM VOLTAGE BUSBAR SYSTEMS (E- LINE MV) GENERAL PRODUCT SPECIFICATIONS

1- Standards & Certification:

-Busbar trunking system shall be designed in accordance with the international standards IEC 62271-200 and IEC 61439-6, type tests thereof shall be conducted and manufactured in accordance with the standard. Type tests shall be conducted by independent and accredited testing and certification bodies with international validity and certified accordingly. Short-circuit type tests and the following 3 main type tests shall be conducted for each current rating of busbar system and conformity certificate for the standards shall be obtained.

2- Overall System Structure

Busbar system should be with low impedance complying with the following specifications. This should be accomplished by placement of the tin coated conductors within the material with no entrapped air within.

2.1- Electrical Values

- Nominal insulation voltage of 12kV busbar trunking system should be 28kV.
- For the tin coated copper, the environmental temperature should be maximum 40 °C while the maximum temperature rise should be 90 K.
- Busbar trunking 3 sec. encryption must be required.
- Minimum short circuit values of busbar should be as follows

For Cu Conductors;

950-2750A : phase-phase 1 sec. value 25kA, peak value 65kA

2.2- Housing and Overall Structure

- Housing of busbar lengths is a special design and should be manufactured from a cast material.
- The structure of the busbar lengths shall have tin plated conductors along their complete length within the housing.

- In the busbar trunking system, there should be down-up and right-left turning elements, panel, transformer and cable connection elements, closure, horizontal and vertical expansion elements as a standard. Special modules and special size busbar lengths that may be required during the implementation of the project should be able to be manufactured within a short time and in accordance with the standard specification and technique.

- If busbar runs pass through the building expansion joint a horizontal expansion element shall be used in the run. Besides, horizontal dilatation element should be used at each 40 m on the horizontal lines.

2.3- Conductors and Phase Configuration

- Busbar trunking systems conductors shall be high conductivity copper with 99.95% / 99.99% between 950-2750A.
- Busbar trunking system should be in the following conductor number and phase configuration

a) 3 Conductors / PE housing

- Copper conductors should be 99.95% electrolytic copper. Minimum conductivity value should be 56 m/mm². Entire surfaces of the electrolytic copper conductors should be tin-coated.

2.4- Insulation Structure

- High conductivity bars; It must be insulated with a special composite material formed by a mixture of specially selected sand, calcite and epoxy resin. This material should be suitable for temperature changes and thermal expansion. High protection should be provided against external impacts.

- Insulation structure must be such that it can operate at -70 + 150 $^\circ$ C.

2.5- Modular Joint Structure

- The phase conductors shall be joined using two junction plates per phase of suitable cross section to maintain the rating integrity of the conductors. These plates shall be secured using bolts with non-sharp tips torqued to 72 Nm. The joint shall be completed using a mixture of epoxy and silicon to match the material of the busbar lengths. This materialshould be compliant with temperature changes and thermal expansion. It should ensure high protection against external impacts. Juncture point bolts should be tightened with torque wrench set to 72 Nm (55 lbft)

3- Assembly and Commissioning Tests

- The assembly of the busbar trunking system should be performed in accordance with the electrical project, electrical single line diagram, layout plans and detailed busbar application projects in line with the type and current values indicated on these plans, instructions provided by the manufacturer should be strictly abided with during the assembly process. Joint bolts shall definitely be tightened by the torque wrench set to correct values and insulated accordingly.

www.eaeelectric.com

- Upon the completion of the assembly of the busbar system and controlling of the compliance to the project thereof and assembly instructions;

a) Di-Electric test with very low frequency should be conducted.

- b) Joint resistances and Line resistances should be measured.
- c) Phase sequences should be checked.

► 24kV Additional Zone Weights

MVC - Cu Conductor		Conductor Dimensions	Weight (kg)
Rated Current	Busbar Code		
1800	18	7x70	36,0
2100	21	7x75	36,0
3200	32	12x100	34,0
4000	40	12x150	41,5
5000	50	12x200	48,0
5700	57	15x200	48,0

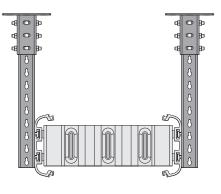

Total mixture weight of 1 Bucket is 15 kg

• When determining the material to be consumed for joint point, the installation of joint point weighing 15 kg and its multiples should be included in the work plan for the same day. Otherwise, since the remaining material will happen a curing reaction, it cannot be used in another day's work plan and will be scrapped. Material planning should be done taking this detail into consideration.

► Two Dimensional Drawings of Panel Modules P10 Panel Mounted Modules

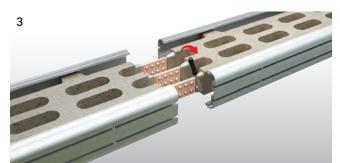

E-LINE MV Horizontal Application

The ends of the conductors of the busbars are cleaned with a clean dry cloth. The busbars have to be fixed in the same axis, with a max. distance of 10 mm between the two conductors.

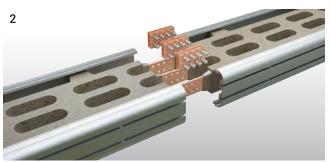

All bolts must be tightened to 72 Nm with torque wrench.

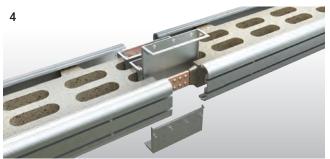

The prepared for casting should be cast from the same spot at all times.

After the curing of the cast material is completed the sheet metal moulds can be removed. (Reaction is completed within 8 - 24 hours based on the air temperature.) The flexibles are fitted to the profiles grooves for earth continuity.

As shown on the figure, junction plates fixed as the bolts face the same direction at all times.

Before assembling the casting moulds, inner surfaces of casting moulds have to be wiped with clean dry cloth.

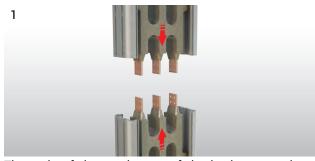

The material should be 'vibrated' with the help of a plastic hammer to remove the air in the material. Then the air bubbles on the surface have to brushed.

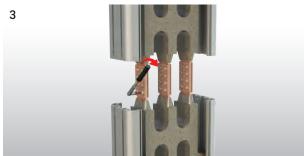

Joint protection pieces of perforated aluminium should be fitted.

The ends of the conductors of the busbars are cleaned with a clean dry cloth. The busbars have to be fixed in the sameaxis, with a max. distance of 10 mm between the two conductors.

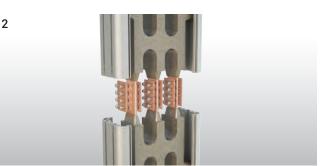

All bolts must be tightened to 72 Nm with torque wrench.

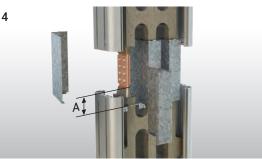

The prepared for casting should be cast from the same spot at all times.

After the curing of the cast material is complete the sheet metal moulds can be removed. (Reaction is completed within 8 - 24 hours based on the air temperature.)The flexibles are fitted to the profiles grooves for earth continuity.

As shown on the figure, junction plates fixed as the bolts face the same direction at all times.

Support sheets are secured on the lower part of juncture area by stem bar. A min. 50-60 mm. The joint moulds are affixed on the support sheet by cleaning with a dry and clean piece of cloth.

The material should be "vibrated" with the help of a plastic hammer to remove the air in the material. Then the air bubbles on the surface have to brushed.

Joint protection pieces of perforated aluminium should be fitted.

1800A TO 5000 A MEDIUM VOLTAGE BUSBAR SYSTEMS (E- LINE MV) GENERAL PRODUCT SPECIFICATIONS

1-Standards & Certification:

- Busbar trunking system shall be designed in accordance with international standards IEC 62271-200 and IEC 61439-6, type tests thereof shall be conducted and manufactured in accordance with the standard. Type tests shall be conducted by independent and accredited testing and certification bodies with international validity and certified accordingly. Short-circuit type tests and the following 3 main type tests shall be conducted for each current rating of busbar system and conformity certificate for the standards shall be obtained.

2-Overall System Structure

Busbar system should be with low impedance complying with the following specifications. This should be accomplished by placement of the tin coated conductors within the material with no entrapped air within.

2.1-Electrical Values

- Nominal insulation voltage of 24kV busbar trunking system should be 50kV.
- For the tin coated copper, the environmental temperature should be maximum 40 °C while the maximum temperature rise should be 90 K.
- Busbar channels 3 sec. encryption must be required.
- Minimum short circuit busbar lengths should be as follows.

For Cu Conductors

800-2100 A : phase-phase 1 sec. value 65 kA, peak value 169 kA 3200-5000 A : phase-phase 1 sec. value 72 kA, peak value 187 kA

2.2-Housing and Overall Structure

- Housing of busbar lengths is a special design and should be manufactured from a cast material.
- The structure of the busbar lengths shall have tin plated conductors along their complete length within the housing.

- In the busbar trunking system, there should be down-up and right-left turning elements, panel, transformer and cable connection elements, closure, horizontal and vertical expansion elements as a standard. Special modules and special size busbar lengths that may be required during the implementation of the project should be able to be manufactured within a short time and in accordance with the standard specification and technique.

- If busbar runs pass through the building expansion joint a horizontal expansion element shall be used in the run. In addition horizontal expansion elements should be used at each 40 m on the horizontal lines.

2.3-Conductors and Phase Configuration

- Busbar trunking system should be copper conductive between 1800-5700A.
- Busbar trunking systems conductors shall be high conductivity copper.

a) 3 Conductors / PE housing

- Copper conductors should be 99.99% electrolytic copper. Minimum conductivity value should be 56 m/mm². Entire surfaces of the electrolytic copper conductors should be tin-coated.

2.4- Insulation Structure

- High conductivity bars; It must be insulated with a special composite material formed by a mixture of specially selected sand, calcite and epoxy resin. This material should be suitable for temperature changes and thermal expansion. High protection should be provided against external impacts.

- Insulation structure must be such that it can operate at -70 + 150 ° C.

2.5-Modular Joint Structure

The phase conductors shall be joined using two junction plates per phase of suitable cross section to maintain the rating integrity of the conductors. These plates shall be secured using bolts with non-sharp tips torqued to 72 Nm. The joint shall be completed using a mixture of epoxy and silicon to match the material of the busbar lengths. This material should be compliant with temperature changes and thermal expansion. It should ensure high protection against external impacts. Juncture point bolts should be tightened with torque wrench set to 72 Nm (55 lbft)

3-Assembly and Commissioning Tests

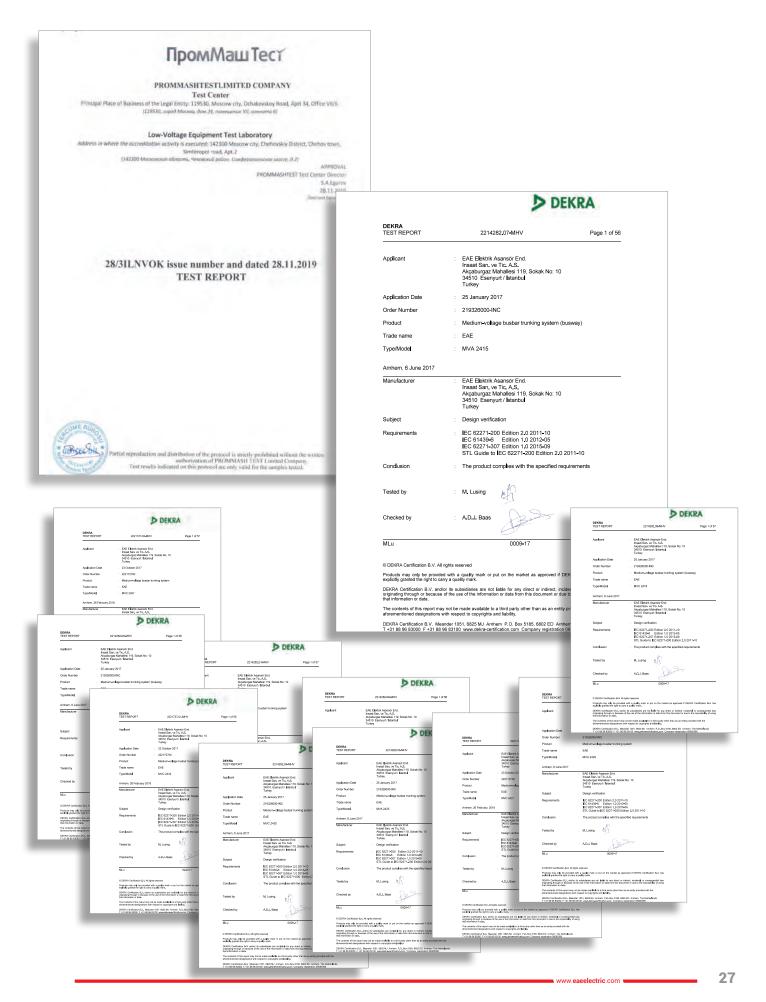

- The assembly of the busbar trunking system should be performed in accordance with the electrical project, electrical single line diagram, layout plans and detailed busbar application projects in line with the type and current values indicated on these plans, instructions provided by the manufacturer should be strictly abided with during the assembly process. Joint bolts shall definitely be tightened by the torque wrench set to correct values and insulated accordingly.

- Upon the completion of the assembly of the busbar system and controlling of the compliance to the project thereof and assembly instructions; a) Di-Electric test with very low frequency should be conducted.

- b) Joint resistances and Line resistances should be measured.
- c) Phase sequences should be checked.
